Project 28 – SeedRoundV5 Security Review

Conducted by: **Georgi Trachev**

Report Version 1.0
June 16, 2026

Contents

1. About Georgi Trachev

2. Disclaimer

3. About Project 28 - SeedRoundV5

4. Risk Classification

4.1. Impact
4.2. Likelihood
4.3. Actions required by severity level

5. Security Assessment Summary

6. Executive Summary

7. Findings

1. About Georgi Trachev

Georgi Trachev is a smart contract security researcher. Throughout his experience he has uncovered numerous critical vulnerabilities in a wide variety of protocols. Reach out on X here.

2. Disclaimer

Smart contract security reviews are a time, resource and expertise bound effort where security researchers do their utmost to find as many vulnerabilities as they can. They are not a 100% guarantee of the security of smart contracts.

3. About Project 28 – SeedRoundV5

The SeedRoundV5 smart contract of the Project 28 fixed-supply DEFI protocol, manages the acquisition and distribution (72% held for LP, 20% sent to treasury, 8% sent to treasury earmarked for SeedLock rewards) of liquidity through ETH and TitanX deposits during a seed round.

4. Risk Classification

Severity	**Impact: High**	**Impact: Medium**	**Impact: Low**
Likelihood: High	Critical	High	Medium
Likelihood: Medium	High	Medium	Low

Likelihood: Low	Medium	Low	Low

4.1 Impact

High: Causes a significant loss of funds, the protocol is directly compromised

Medium: A minor amount of funds at loss, or a functionality of the protocol can be affected

Low: Unexpected behaviour in the protocol, but does not present a significant harm

4.2 Likelihood

High: Direct attack vector; cost of attack negligible, compared to funds at risk

Medium: A sophisticated attack vector that is incentivized only in some conditions but is still likely to occur

Low: Requires many unlikely assumptions or the attacker is not incentivized

4.3 Actions required by security level

High: Issue **MUST** be fixed

Medium: Issue **SHOULD** be fixed

Low: Issue **MAY** be fixed

5. Security Assessment Summary

Overview

Repository: https://github.com/Allykane32/p28-contracts-v1/blob/seedRoundV5/contracts/SeedRoundV5.sol

Commit hash: 950a9a50764421ec3ec8a7d9c8591af08e98ba6c

Scope

The smart contracts included in the scope of the security review:

- contracts/SeedRoundV5

Timeline

Audit start: June 9, 2026

Audit end: June 12, 2026

6. Executive Summary

Throughout the security review, 1 Low severity and 1 Informational severity issues were discovered.

Findings count

High Risk	0
Medium Risk	0
Low Risk	1
Informational	1

7. Findings

7.1 Low Findings

[L1] Seed round may fail to finalize successfully due to low decimal precision.

Severity: *Low*

Context: SeedRoundV5.finalize

Description: In the *finalize* function of the SeedRoundV5 contract the total value of the allocated tokens is calculated as follows:

```
uint256 totalValue = totalTokensAllocated * PRICE_USD / 1e18;
```

Here *PRICE_USD* uses only 3 decimals of precision, thus *totalValue* will also be assigned a 3 decimal value. This is problematic as even if the *totalTokensAllocated* meet the minimum success participation limit, the *totalValue* will be rounded down by a significant amount, causing the seed round to not be successful.

Recommendation: Consider increasing the decimal precision in the finalize function when calculating *totalValue.*

Resolution: Acknowledged.

7.2 Informational Findings

[I1] Provision of *SEED_SUPPLY* risk

Description: Transferring the *SEED_SUPPLY* to the contract should only occur once the total value has reached

MIN_SUCCESS_PARTICIPATION, as otherwise if the seed round is not successful the P28 supply will be stuck in the contract.
